

1 Multi-Currency Wallet Simulator

2 Static Testing + White-Box Coverage

3 Static analysis is executed automatically in the CI pipeline on every push and pull request. We
4 used Pylint for fast code-quality feedback and SonarCloud for maintainability/security reporting
5 and for importing the unit-test coverage report (coverage.xml). This makes the static results
6 reproducible and consistent with the submitted codebase (not dependent on local runs).

7 **Coverage measurements:** Coverage was calculated using pytest-cov and interpreted as
8 statement coverage (executed lines) and decision/branch coverage (executed conditional
9 paths). We report two views because they answer different questions:

- 10 ▪ Unit-test coverage: how much of the internal Python logic (domain + services) is exe-
11 cuted by unit tests (white-box focus).
- 12 ▪ Unit + integration execution: how much of the full vertical slice is executed when inte-
13 gration tests are included (routes → services → repositories → SQLite).

Metric	Before	After
Unit coverage (pytest-cov)	41% (108 tests)	63% (127 tests)
Executed lines (statement) incl. integration	89% (116 tests)	93% (135 tests)
SonarCloud coverage (coverage.xml)	40.9%	63.4%
SonarCloud quality gate	Passed	Passed

14 Meaning (how to read the numbers)

- 15 ▪ **Unit coverage (41% → 63%)** increased because we added targeted white-box unit tests
16 for previously unexecuted branches/decisions in internal logic (services + rules).
- 17 ▪ **Unit+integration (89% → 93%)** The combined coverage is already high because inte-
18 gration tests execute many lines through the API wiring. The smaller increase means
19 the main gap was branch coverage inside logic, not missing route execution.
- 20 ▪ **SonarCloud (40.9% → 63.4%)** matches the unit view because it imports unit-test cov-
21 erage.xml, so it reflects improvement in white-box unit coverage.

22 Coverage gap → action → outcome

Coverage gap	White-box tests added	Value / outcome
Did not handle “non-numeric rate” safely	White-box tests for mal-formed FX payloads	Bug fixed: API now fails predictably (502) instead of crashing
Service-layer “happy path” never executed	White-box test for list_transactions	Confirms service works without needing DB/HTTP
Exchange decision branches were not executed	White-box tests targeting exchange rule branches	Higher confidence that key rule decisions are exercised by tests

23 **Conclusion:** Static analysis and coverage are integrated into CI and therefore reproducible.
24 Coverage was used diagnostically to identify unexecuted internal branches; targeted white-
25 box tests increased unit coverage (41% → 63%) and directly improved robustness at the exter-
26 nal FX boundary and domain logic.
